canine anatomy guide download: How to use 3D Printing Innovations and Digital Storage to Democratize Anatomy Education Leonard Shapiro, 2024-11-05 This edited book contains chapters that describe bespoke three-dimensional (3D) printing aimed at democratizing anatomy education by providing open-source scans for download and printing as 3D models. The long history of anatomical models as educational resources is explored in fascinating detail, from wax models through to a range of cutting-edge 3D printers. In a related chapter, a veterinary anatomy educator describes a transformation in teaching and learning methods in veterinary education using Augmented Reality (AR), Virtual Reality (VR) and 3D visualization methods like CT or MRI images which can be used to reconstruct complete 3D virtual models, as well as 3D prints from these reconstructed scans. The first digital, cloud-based human skeletal repository in southern Africa is an extensive and categorized 'bone library' globally accessible for use in education and research. A chapter details a digital protocol for the bioprinting of a 3D acellular dermal scaffold (ADS) for use in wound healing, as an alternative to skin grafting for secondary intention wound healing. A chapter offers an extensive guide to applied anatomy for acupuncture and is provided in 4 parts viz, upper limb, lower limb, trunk, head and neck. Each part of the chapter is replete with beautiful cadaveric images including annotations that relate specifically to information in the text. We look at vertebral artery variations and its role in clinical conditions, current insights into polycystic ovarian syndrome, and visual interpretation using multiplex immunoassay of serum samples. This book will appeal to educators of both human and animal anatomy who have a keen interest and focus on the use of bespoke 3D printing, augmented and virtual reality, as well as acupuncture practitioners, clinicians, regenerative medicine specialists, surgeons, tissue engineers and artists.

Subsequent chapters in this section compare human and animal studies in anatomical research, discuss how to conduct systematic reviews, cover essential aspects of data analysis and management in anatomical research, outline methods for sharing anatomy research findings, and highlight the vital role of cadavers in advancing anatomical knowledge and medical education. Finally, this section explores the methods and approaches used to study and improve anatomy education. The second section explores various specialised research areas in detail. It provides guidance and insights on several topics, including developmental anatomy research, the use of surgical observations for anatomical research, and morphometric studies in anatomy. Additionally, it discusses the application of medical imaging tools for anatomical studies and the significance of macroscopic and microscopic examination and imaging techniques in neuroanatomical research. Finally, this section explores anatomical variability - A research methods book that is tailored to anatomical research - Presents a variety of research designs applied in anatomical research based on cadavers, surgical observations, medical imaging, morphometric studies, and microscopic studies - Inspires early career anatomists to identify possible future research areas

canine anatomy guide download: Applied Clinical Dog Anatomy Guide, 2015 canine anatomy guide download: Guide to the Dissection of the Dog Malcolm E Miller,

2020-12-06 This manual represents an experiment both as to choice of animal and plan of work. The dog has been chosen as subject of dissection instead of a large herbivore for several reasons. The student-specimen ratio can be reduced with a resultant increase in time for dissection by the individual student. At the same time more material can be covered in a given period than by using the horse or ox owing to the smaller size of the specimen and the ease with which structures are cleaned and visualized. These and other advantages result not only in better preparation of a student to study the more economically important animals, but also increases the time that can be devoted to the study of those regions most often involved surgically. The dog is cheaply purchased, preserved and prepared for dissection. After the arteries are filled with red latex they stand out more vividly than in life. The large systemic veins can also be injected. A large part of a dissected dog can be seen in a single field of vision. Structures can be left in place, e.g., the heart is dissected without removing it from the thorax. Terms used in veterinary anatomy are largely taken from human anatomy. Since in the dog structures closely resemble those of man, an advantage in making homologies to the mutual benefit of teacher and student results. In general all terms have been Anglicized except most names of muscles, and even these Latin names have been used as if they were English in some places. The Latin terms were retained to differentiate muscles from nerves and vessels; furthermore most veterinarians prefer to use them. The improved BNA or INA terminology has been used almost entirely. Needless to say the excellent texts of Ellenberger and Baum, and Sisson and Grossman have been used frequently as references. It is probable that both have influenced the terminology more than they should, since a uniform terminology is desired by all anatomists.

canine anatomy guide download: A Guide to the Dissection of the Dog Orlando Charnock Bradley, 2015-06-02 Excerpt from A Guide to the Dissection of the Dog During recent years the feeling that there was room for a book in English dealing with the anatomy of the dog has been steadily gaining ground. Doubtless, in the opinion of many, the gap can be adequately filled only by a systematic treatise similar to the classic 'Anatomie des Hundes' of Ellenberger and Baum. Until some such work makes its appearance, perhaps the present publication may serve as a temporary means of supplying the deficiency. For several reasons it was decided to introduce the subject of canine anatomy to the English reader in the form of short notes planned to aid him in his desire to obtain first-hand knowledge by dissection. Herein are given directions which experience has shown will help the student to display the various organs and structures in an orderly and profitable manner. The descriptions which follow are purposely given in the briefest possible form, in order that the dissection of the whole animal may be accomplished within a reasonable length of time. While primarily intended for the guidance of the student who proposes to join the ranks of a profession which already contains a fair number of specialists whose work necessitates a close knowledge of the anatomy of the dog, it is hoped that these notes may be of some service to the student of comparative anatomy who wishes to gain an acquaintance with the structure of an easily obtained mammal. The nomenclature herein employed is that which may be called the Baden and Stuttgart modification of the B.N.A. of the human anatomist; and, if not perfect, is infinitely better than the nondescript nomenclature, crowded with synonyms, formerly found in works on comparative anatomy. My thanks are due to my colleague, Mr. W. M. Mitchell, M.R.C.V.S., for assistance in many directions; and to the publishers for the cordial manner in which they have met my suggestions.
