clinical practice ethics download: Islam and Biomedical Research Ethics Mehrunisha Suleman, 2020-07-07 This book is a contribution to the nascent discourse on global health and biomedical research ethics involving Muslim populations and Islamic contexts. It presents a rich sociological account about the ways in which debates and questions involving Islam within the biomedical research context are negotiated - a perspective which is currently lacking within the broader bioethics literature. The book tackles some key understudied areas including: role of faith in

moral deliberations within biomedical research ethics, the moral anxiety and frustration experienced by researchers when having to negotiate multiple moral sources and how the marginalisation of women, the prejudice and abuse faced by groups such as sex workers and those from the LGBT community are encountered and negotiated in such contexts. The volume provides a valuable resource for researchers and scholars in this area by providing a systematic review of ethical guidelines and a rich case-based account of the ethical issues emerging in biomedical research in contexts where Islam and the religious moral commitments of Muslims are pertinent. The book will be essential for those conducting research in low and middle income countries that have significant Muslim populations and for those in Muslim-minority settings. It will also appeal to researchers and scholars in religious studies, social sciences, philosophy, anthropology and theology, as well as the fields of biomedical ethics, Islamic ethics and global health..

While the popular press and politicians often take the view that the more innovation, the better, the chapters in this edited volume reflect on the harmful effects of innovation on society and the environment. The book begins with a broad discussion of the dark side of innovation, followed by contributions by various experts in the area. It is a critical reply to the innovation optimists, complementing the list of indicators that show steady human progress with a list of indicators that show sustained deterioration (largely due to innovation). The volume outlines some relevant dimensions of harmful innovation, before distinguishing between the types of harm brought on by innovation. The various contributed chapters focus on the following themes: a bibliometric analysis of the scientific literature on the harmful consequences of innovation; harmful side-effects from solar photovoltaic waste; harmful consequences of process innovations on working practices in areas such as accountancy; the difficulties of transferring innovations from research to practice in clinical healthcare; and the harmful consequences of social innovations. The chapters in this book were originally published as a special issue of the journal *Industry and Innovation*.
