health advocacy methods download: An Introduction to Population-level Prevention of Non-Communicable Diseases Mike Rayner, Kremlin Wickramasinghe, Julianne Williams, Karen McColl, Shanthi Mendis, 2017-03-09 Non-communicable diseases (NCDs) kill more people than anything else in the world. They include cardiovascular diseases, such as heart attacks and strokes; cancers; chronic respiratory diseases, such as chronic obstructed pulmonary disease and asthma; and diabetes. In 2013, the World Health Organization published a global action plan for the prevention and control of NCDs which set a target to reduce death rates from NCDs by 25% by 2025. In response, countries have been drawing up national-level NCD prevention policies and programmes. New departments have been created by governments, NGOs, and other organizations to drive this agenda forward, creating a need for capacity building and training. In response to this need, the Nuffield Department of Population Health and the Department for Continuing Education at the University of Oxford initiated an accredited six-day short course on prevention strategies for non-communicable diseases with a population-based approach. In the past, many attempts to engage with NCD prevention have centred on individual-level interventions, such as screening and treating individual patients. In this new book, the course organisers provide a solid introduction to the population-based approach and bring together the concepts, evidence, and methods that define it. *An Introduction to Population-Level Prevention of Non-Communicable Diseases* takes readers through the entire policy cycle: from problem definition, solution generation, capacity building, and implementation to evaluation and monitoring. The book includes a wide range of case studies and practical examples of plans and projects that illustrate the real-life applications of theory. This book provides an unparalleled overview of population-based approaches to the prevention of non-communicable diseases, reflecting the latest research in the field. It is a key resource for anyone with an interest in NCD prevention, particularly early-career professionals working in governments, NGOs, health care institutions, and universities as they develop the knowledge and skills required for effective population-based prevention strategies.

health advocacy methods download: A Canadian Healthcare Innovation Agenda A. Scott Carson, Kim Richard Nossal, 2018-04-30 This collection is the result of a 2016 national leaders conference sponsored by Queen's University to explore the prospects for a pan-Canadian healthcare

innovation strategy. The conference themes were inspired by the 2015 report of the federally commissioned Advisory Panel on Healthcare Innovation, led by David Naylor, which examined how the federal government could support innovation. A Canadian Healthcare Innovation Agenda features original commissioned chapters from academics and healthcare leaders addressing a range of issues such as the meaning of healthcare innovation, how a national healthcare agency and investment fund could be governed, the need for big data and evidence, adding value through Canadian supply-chain management, overcoming regulatory barriers to innovation, policy innovations for indigenous, military and elderly populations, the role of medical professions in promoting innovation, education, and the development of medical innovators. The Canadian healthcare system is so fragmented that any thought of a system-wide strategy for healthcare innovation is considered a far-distant ideal at best. This book presents a contrary view, outlining an agenda for Canadian healthcare innovation. It shows that Canada does indeed have the building blocks for innovation, and concludes that the time to act is now.

This new *Textbook of Palliative Care* remains a unique, comprehensive, clinically relevant and state-of-the art book, aimed at advancing palliative care as a science, a clinical practice and as an art. Palliative care has been part of healthcare for over fifty years but it still needs to be explained to many. Healthcare education and training has been slow to recognize the vital importance of ensuring that all practitioners have a

good understanding of what is involved in the care of people with serious or advanced illnesses and their families. However, the science of palliative care is advancing and this new edition will contribute to a better understanding. This new edition offers 86 updated or new chapters out of 108, written by experts in their given fields, providing up-to-date information on a wide range of topics of relevance to those providing care towards the end of life no matter what the disease may be. We present a global perspective on contemporary and classic issues in palliative care with authors from a wide range of disciplines involved in this essential aspect of care. The Textbook includes sections addressing aspects such as symptom management and care provision, organization of care in different settings, care in specific disease groups, palliative care emergencies, ethics, public health approaches and research in palliative care. This new Textbook will be of value to practitioners in all disciplines and professions where the care of people approaching death is important, specialists as well as non-specialists, in any setting where people with serious advanced illnesses are residing. It is also an important resource for researchers, policy-and decision-makers at national or regional levels. Neither the science nor the art of palliative care will stand still so the Editors and contributors from all over the world aim to keep this Textbook updated so that the reader can find new evidence and approaches to care.
