Sundararajan, 2025-05-29 This book offers a comprehensive first-level introduction to data analytics. The book covers multivariate analysis, AI / ML, and other computational techniques for solving data analytics problems using Python. The topics covered include (a) a working introduction to programming with Python for data analytics, (b) an overview of statistical techniques - probability and statistics, hypothesis testing, correlation and regression, factor analysis, classification (logistic regression, linear discriminant analysis, decision tree, support vector machines, and other methods), various clustering techniques, and survival analysis, (c) introduction to general computational techniques such as market basket analysis, and social network analysis, and (d) machine learning and deep learning. Many academic textbooks are available for teaching statistical applications using R, SAS, and SPSS. However, there is a dearth of textbooks that provide a comprehensive introduction to the emerging and powerful Python ecosystem, which is pervasive in data science and machine learning applications. The book offers a judicious mix of theory and practice, reinforced by over 100 tutorials coded in the Python programming language. The book provides worked-out examples that conceptualize real-world problems using data curated from public domain datasets. It is designed to benefit any data science aspirant, who has a basic (higher secondary school level) understanding of programming and statistics. The book may be used by analytics students for courses on statistics, multivariate analysis, machine learning, deep learning, data mining, and business analytics. It can be also used as a reference book by data analytics professionals.

**tester 68 guide:** *Tutorial Topics in Infection for the Combined Infection Training Programme*

Cheuk Yan William Tong, Caryn Rosmarin, Armine Sefton, 2019-07-04 Microbiology and virology laboratories provide a diagnostic service that supports the management of patients under the care of front-line clinicians. Despite the significant overlap, laboratory expertise and clinical patient management are traditionally viewed as independent entities. Trainees in the infection disciplines of microbiology, virology, infectious diseases, and tropical medicine have until recently received separate, and as a result, limited training. To address this problem, the UK replaced the FRCPATH Part 1 examination for infectious disease trainees with a combined infection training (CIT) curriculum in 2015. Based on the idea of integration and collaboration within the field, CIT links laboratory expertise to clinical patient management. Tutorial Topics in Infection for the Combined Infection Training Programme is the first book covering the complete CIT curriculum. Following the format of the CIT certificate examination, each chapter ends with three single best answer multiple choice questions accompanied by in-depth discussions. This extensive content helps students appreciate the breadth of knowledge required, emphasises how the different aspects of the field are

related, and is an essential tool for those preparing for the CIT certificate examination. Written by a multi-disciplinary team of medical microbiologists, virologists, infectious disease physicians, clinical scientists, biomedical scientists, public health specialists, HIV clinicians, and infection control nurses, this well-illustrated and easy to use book offers a unique insight into infectious diseases. It is the perfect primer for further study, a starting point for medical students and professionals wishing to learn more about the different topics within the infection specialty, and ideal for biomedical scientists looking to broaden their clinical understanding of the field beyond the diagnostic test.
